Snocrete® C Model Snow Blowers

Engineering & Design

300° Spout Rotation

Casts snow backwards or in any direction allowing passage around obstacles without hitting them with discharge

Single Center Spout

A single center spout provides the operator with better visibility and cleaner operation compared to previous twin spout models

High Profile Spout

Tall reinforced spouts carry the snow up and out of the vision of the operator.

Bolt On Ice Chopper Bars

Break up snow and ice while cleaning the corners away for an easy and even feed. Easily replaceable bars work in parallel with shear bolts. Together the machine is protected against foreign objects minimizing downtime with easy serviceability.

Easy Access Shear Bolts

Bolt holes use heat-treated inserts to keep holes from elongating after extended use

Single Stage Design

The Snocrete® single stage design has the highest performance per tractor horsepower of any blower on the market. The twin fan design is engineered for extreme duty applications with its resilience to foreign objects and the ability to blow through rock hard snow and ice.

Clean Operation

Rubber flaps contain snow for clear operator visibility

Hydraulic Spout Capper

Standard spout that allows operator to cast when blowing around obstacles

Spout Enclosure

Prevents dusting and improves visibility

Heavy Duty Chain Drive

Drive chains are enclosed in oil bath lubrication for worry free operation

Bolt-On Reversible Cutting Edges & Skid Shoes

Optional Truck Loading Spout
